SUMMARY

Computer Engineering graduate (Tokat Gaziosmanpaşa University, 2025) with hands-on experience in SQL, PostgreSQL, data modelling, data processing and backend development. Experienced in building data validation and transformation pipelines and working with structured and unstructured data using Python and Node.js; I validate every rule with unit tests, CI gates and statistical confidence intervals before it ships. Built processing layers that turn free text into schema-conformant data through LLM integration (Claude API structured outputs, MCP server). Strong interest in master data management, data quality, data governance and process automation.

EXPERIENCE

Computer Engineering Intern | Eduji R&D Software Design and Consultancy Inc.

Bornova, İzmir, Türkiye | July 2024 – September 2024

- Implemented REST API integration and contributed to querying and transforming large data sets through server-side filtering and pagination logic.
- Implemented token-based authentication, state management with GetX, and secure data storage with FlutterSecureStorage.
- Contributed to the development of a survey-based, reward-driven mobile application with Flutter; designed the UI in Figma.
- Tested backend APIs with Postman to validate data contracts, working in close coordination with the backend team.

PROJECTS

Portfolio Tracker | Node.js (Express), PostgreSQL, Python, Claude API · github.com/KaanCan1/portfolio-tracker

- A full-stack web application that tracks a stock, fund and gold portfolio on live prices, generates trading signals from technical analysis and measures the return of each signal; all layers built by me.
- Designed a 40+ endpoint REST API and relational data model on Express + PostgreSQL; integrated three financial data providers (Finnhub, TwelveData, Yahoo) behind a fallback chain so the system keeps running when one of them is unavailable.
- Built a processing layer using Claude API structured outputs to convert unstructured financial text into schema-conformant structured data; schema validation ensures data quality and prevents rejected records from being silently swallowed.
- Measured silent data loss under concurrent writes — five parallel requests to the same record, all returning HTTP 200 while only one record persisted; fixed it with a single-writer queue wrapping the read-modify-write cycle, and CI now rejects any direct write.
- Wrote a measurement layer that tests every signal rule over a 17-month / 360-bar window with confidence intervals from block bootstrap, correcting for day clustering and overlapping windows; no unmeasured rule reaches production.
- Developed a risk module implementing Value at Risk (VaR) and Monte Carlo simulation (Cholesky-correlated scenarios); portfolio return is computed as TWR, stripped of cash flows and measured against a benchmark.
- Integrated an MCP (Model Context Protocol) server enabling the language model to query the database through tool calls.
- Set up 283 unit tests (node:test) and a GitHub Actions smoke test that actually boots the server and requests the main endpoints; containerised with Docker and deployed on Render.

Sepet — Personal Inflation Index | Flutter, Node.js, PostgreSQL, OCR · github.com/KaanCan1/Sepet

- Built an iOS app that computes personal inflation from a user's own receipts, using the official index's method (chained Laspeyres) with weights derived from the user's 12-month spending.
- Monthly chaining keeps the index series continuous when the user's basket changes; weights are re-derived each period and linked to the previous one.
- Wrote the scoring-based matching layer in PostgreSQL that maps abbreviated receipt-line product names onto a canonical product catalogue; calibrated its threshold against labelled and adversarial cases to reduce false matches.
- Ran the OCR on the device, so only parsed lines reach the server and the receipt image never leaves the phone — a decision that also cut backend cost and latency.
- Designed the Node.js REST API and PostgreSQL schema; product catalogue, price history and user baskets are kept in normalised tables.

EDUCATION

Tokat Gaziosmanpaşa University | BSc in Computer Engineering | 2021 – 2025

GPA: 88.02 / 100

- Relevant coursework: database management, data structures and algorithm analysis, artificial intelligence, machine learning, statistics, and network security.
- Coursework extended with dynamic web projects in PHP/MySQL and native mobile apps in Java/Android Studio, alongside technical presentation experience.

TECHNICAL SKILLS

Data & Databases: SQL, PostgreSQL, MySQL, SQL Server, SQLite, data modelling, data integration via REST APIs, data validation, schema design, data quality

AI / NLP: Claude API (structured outputs, prompt engineering, MCP), scikit-learn, natural language processing, machine learning

Programming Languages: Python, SQL, JavaScript, Dart, Java, C#, PHP

Backend & Tools: Node.js, Express, REST API, Docker, CI/CD, GitHub Actions, Git, Postman, unit testing (node:test)

Mobile Development: Flutter, GetX, Firebase, Firebase Cloud Messaging, Android Studio, OCR

Other: Object-oriented programming (OOP), UI/UX design, Agile/teamwork

CERTIFICATES AND LANGUAGES

Certificates: Huawei & CloudMetrik – Cybersecurity Bootcamp (2026) · BTK Academy – Cybersecurity

Languages: Turkish — Native · English — B2 (Upper-Intermediate)
